Suggestions for Specifying Ornamental Metal

1 MATERIAL: If iron, to be best grade American or Swedish Iron, sample of iron to be approved by Architect.

2 SHOP DRAWINGS: To be submitted in triplicate either directly to Architect or through General Contractor.

3 MODELS: To be furnished by the Architect at the owner's expense or to be included by the Metal Craftsmen at their expense as directed by the Architect.

4 SAMPLE: When work indicated on details is to be executed in special finish, a sample section of work to be furnished is to be submitted.

5 NOTICE TO BIDDER: The owner and Architect are expecting and will pay for artistic execution of the metal work to be carried out according to best tradition and methods of the Craft. No substitution of metal, nor inferior metal, nor any but the best of craftsmanship will be accepted.

6 HAND WROUGHT METAL: Where required, wrought metal is to be hand-hammered in the best traditional manner.

7 FINISHES: All wrought iron not to have "special" finish to be painted with one coat of red lead and two coats approved flat black rust-proof paint. When "special" natural half-polished finish is required, the metal should be scraped, cleaned, and pickled to remove all foreign substances; the iron then covered with a coating of linseed oil and heated over a charcoal fire to absorb the oil—after again cleaning—the entire surface is to be protected with a combination of bees'-wax and boiled linseed oil.

Regarding Rust: *Rust cannot be entirely prevented. Different climatic conditions have varying effects on both bronze and iron. The only remedy is constant care either by paint or application of wax or varnish. Cadmium and chromium plating are recommended for interior purposes only—for exterior purposes this method of rust-proofing is still in the experimental stage. All polished or half-polished iron must be treated with wax and oil at intervals to insure prevention of rust.*
